Molecular Mechanisms Underpinning The Development

General Interest Molecular Mechanisms Underpinning the Development of Obesity Obesity is a multi-factorial disease, in which an excess of accumulated body fat can reach levels capable of affecting health. It results from an interplay between environmental factors, eating behavior, genes, epigenetics, and neuronal stimuli.

The absence of interaction of adult trauma with functional FKBP5 genotypes in psychiatric risk suggests an additional molecular mechanism for FKBP5 by childhood trauma interactions. FKBP5 is a gene with a number of upstream and intronic GREs that likely exert their enhancer function by looping back to the transcription start site 12, 40. The function of these GREs is moderated by both genetic variation and environmental factors, the latter being mediated via epigenetic mechanisms.

On the Molecular Mechanisms Underpinning the Development of Obesity Obesity and overweight are defined as abnormal or excessive body fat accumulation, possibly due to an imbalance of excess energy intake and reduced energy expenditure. This excessive fat accumulation can reach levels capable of affecting

The molecular mechanisms underlying the switch between Th17 phenotypes may represent novel therapeutic targets in RA. Abstract T helper 17 (Th17) cells are important mediators of immune responses against extracellular bacteria and fungi, and as such play critical regulatory roles in maintaining mucosal homeostasis.

Mechanisms Underpinning the Beneficial Effects of Polyphenols. Nrf2 binds to the antioxidant-responsive element (ARE) with high affinity and plays a central role in the upregulation of genes implicated in the regulation of the cellular redox status and the protection of the cell from oxidative insult [143, 144].

Molecular Biology of Cancer: Mechanisms, Targets, and Therapeutics offers an accessible, engaging, and optimistic account of cancer biology for undergraduate and graduate students. Using the hallmarks of cancer as a starting point, the book looks at the cellular and molecular mechanisms underpinning the transformation of cells into cancer cells.
